#webdev

The development of websites consists of two main layers which are frontend and backend. Each layer has its purpose to fulfil and are both dependent on each other to produce a product which a user can interact with. My goal in this article is to expound on these two layers and their significance in the development of a website.

What is frontend?

Frontend also known as client side refers to what the user of your website sees and interacts with. This refers to things like forms, buttons, animations, menus and so on.

The main objective when designing the frontend part of a website is to make sure that the website is user-friendly in terms of how the user will be interacting and accessing different components of your website. For example the use of background colours that are in contrast with the text in order to improve legibility

Frontend languages

When designing the frontend part of a website there are three main languages which are commonly used i.e Html, css and Javascript
